

Alarm Notification

Alarm notification function makes iVMS-4500 a professional and powerful private security guard for 7X24 surveillance. Once there are events occurring, notification will be instantly pushed to your mobile device, then you can either play back what just happened or live view what is happening. This function provides a more effective way to secure your property and your family.

Applications

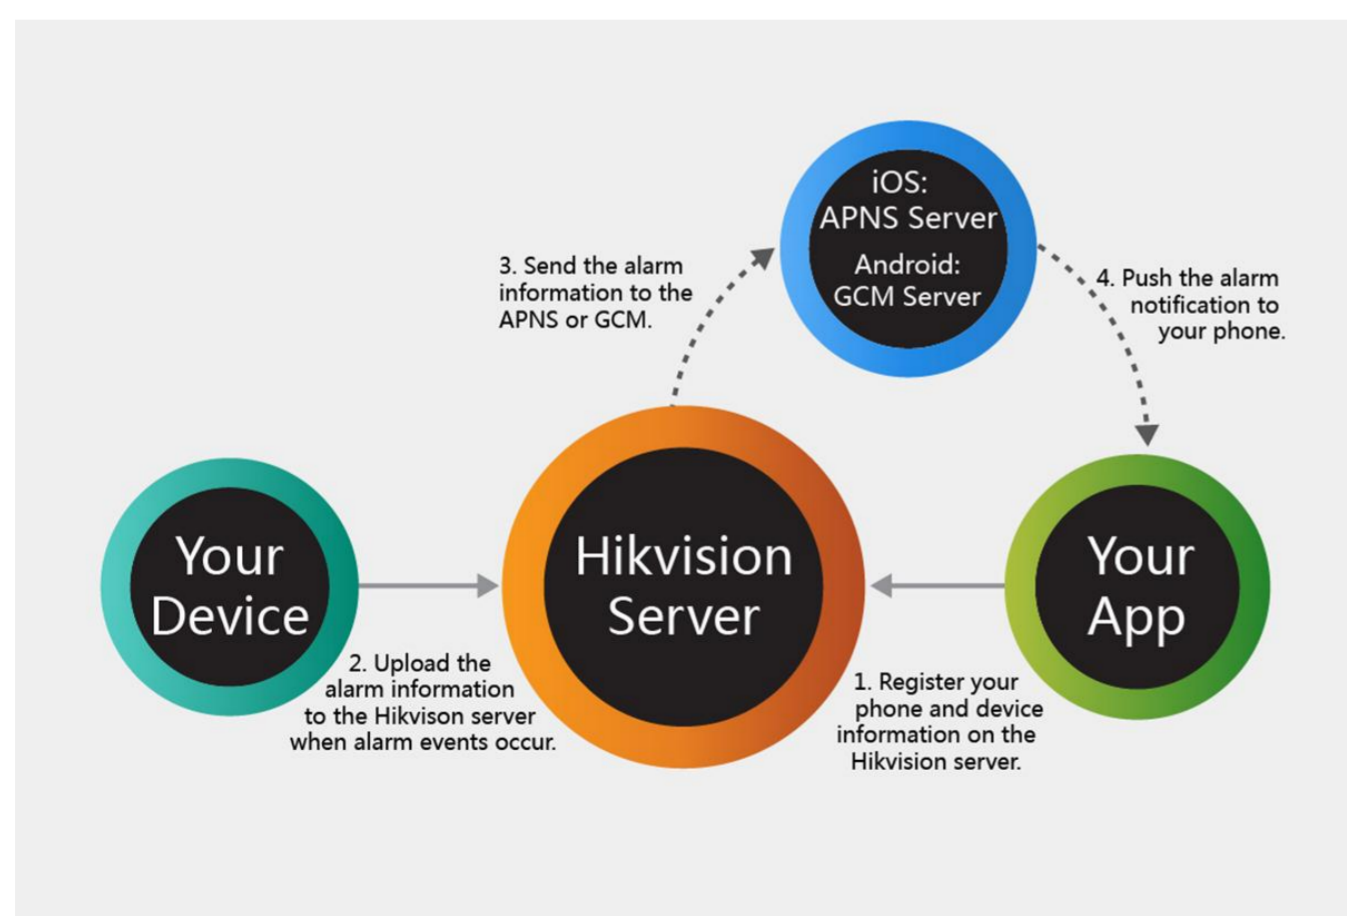

For Household: Keep an eye on your children, the older and your pets; guarantee the security of your family and property.

For Enterprise: Monitor the status of your businesses and shops, and protect them from losses.

How Alarm Notification Works

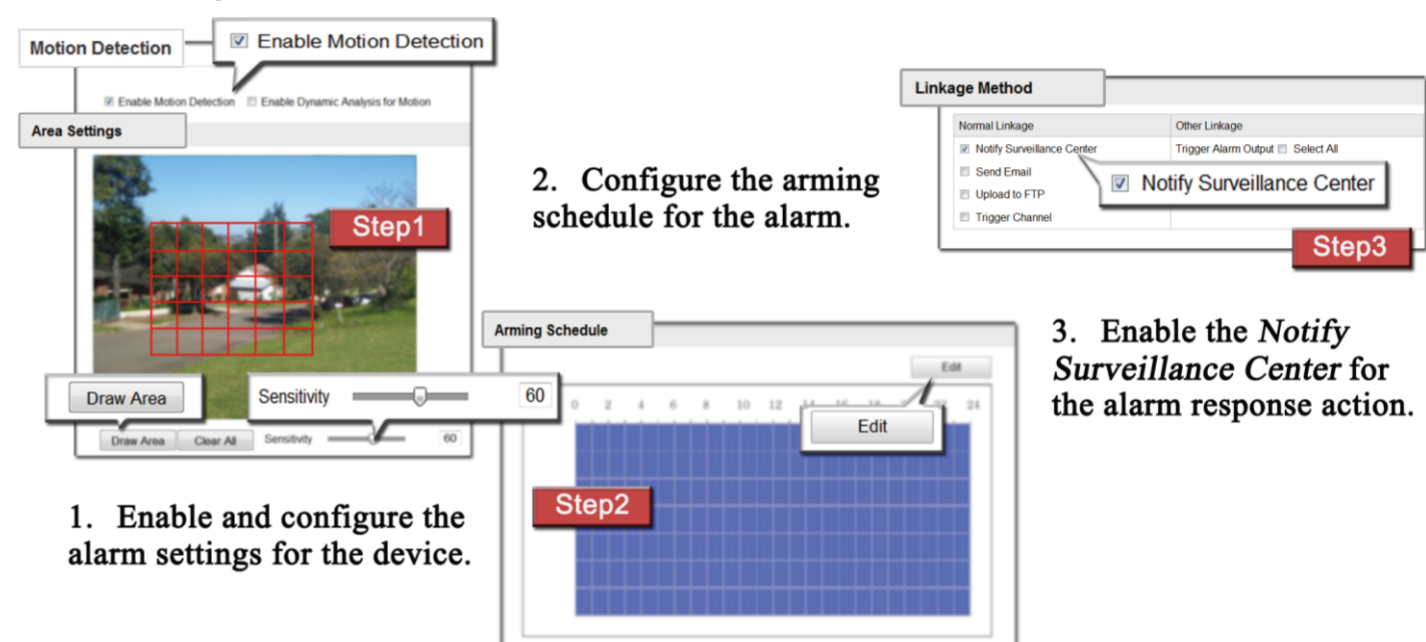

Comparing with Traditional Security System

Alarm Notification is capable of pushing the alarm information to your mobile device immediately after the events occur, and helps you get the latest status of your property at anytime and anywhere without costing massive labor and resource on monitoring security system all the time.

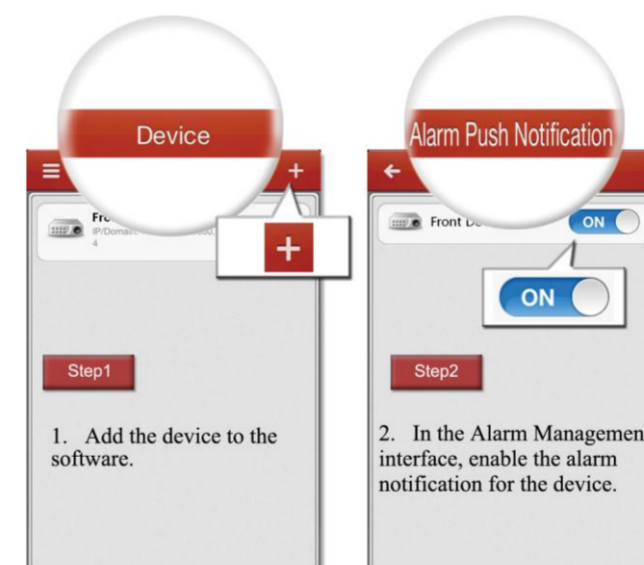

How to Configure

With our free mobile client software iVMS-4500 installed on your mobile device, the alarms detected by your network camera, DVR or other devices can be sent to you automatically by performing the following simple configuration.

In the device (example: configuring motion detection via web browser)

In the iVMS-4500

After the above configuration, you can receive the alarm notification right after the alarm occurs and you can check the related live video or record file immediately.
